PROJECT OVERVIEW

Turning transactions into business insight

Sales transaction data captures every order a business processes, but on its own it rarely answers business questions. This project analyzes McDonald's order-level sales data in Excel to understand revenue, order behavior, and menu performance — then presents those findings through an interactive dashboard.

FOCUS AREAS

-  **Revenue**
Total and category-level sales performance
-  **Orders**
Order volume and daily patterns
-  **Menu Popularity**
Which items drive orders and revenue
-  **Time Trends**
How ordering shifts across hours and days

PROJECT SNAPSHOT

12,234

Transaction-detail rows

5,370

Unique orders

32

Menu items

Jan 1 – Mar 9, 2023

Date range covered

Objective: convert raw order-level data into a clean, explorable analysis that answers concrete business questions.

DATASET

Two source tables, joined on item ID

Every order-detail row is matched to its menu item to pull in category and price, while a left outer join ensures no transaction record is dropped — including the small number without a matched item.

Validating and cleaning before analysis

No duplicate rows
in either table

No duplicate IDs
menu_item_id & order_details_id

No nulls in Menu Master
all 32 items complete

137 missing item_id
found in Orders Data

THE CLEANING DECISION

Forward/backward filling was evaluated for the 137 missing item_id values, but rejected — item_id is a categorical identifier, and filling it would assign products without evidence and distort item- and category-level revenue. These rows were instead retained as unidentified transactions, surfaced through a Category_Display field labeled “Unidentified” rather than left blank.

Fields engineered for analysis

Since the dataset has no quantity column, each order-detail row is one ordered item — so revenue is calculated directly from item price.

TIME-OF-DAY GROUPS

Day_Type splits every order into Weekday or Weekend for comparison, while Order_Hour and Time_of_Day group orders into the four shifts above for pattern analysis.

Ten business questions guided the analysis

Grouping the questions this way kept the Excel build focused each group maps directly to a set of PivotTables and dashboard visuals.

- What is the total sales revenue for each category of menu items?
- How many orders are placed each day?
- Which menu item is the most frequently ordered?
- What is the total revenue generated by menu items?
- How does the revenue of each category compare over months?
- What is the average number of items per order?
- How do order volumes vary by time of day?
- How do sales trends differ across weekdays and weekends?
- How does the sales performance vary by category over different months?
- Compare the sales of top 5 menu items.

Revenue

- Total revenue by category
- Revenue by menu item

Orders

- Daily order volume
- Average items per order

Menu Performance

- Most frequently ordered item
- Top 5 items by revenue

Time Trends

- Order volume by time of day
- Weekday vs. weekend sales

Category Trends

- Category revenue by month
- Category sales trend over time

One interactive view of the full analysis

FINDINGS

Burgers dominate category revenue

\$21,459.99
Burger — top revenue category

\$44,029.38 vs \$16,974.40
Weekday vs. weekend revenue

Category revenue and the monthly breakdown (in the live dashboard) show Burger, Chicken, and Pasta consistently leading across January–March, with weekday trading generating roughly 2.6x weekend revenue.

FINDINGS

Meatball Marinara — \$4,225.30 leads on revenue, Big Mac on volume

622 orders

Big Mac is the most frequently ordered item on the menu

\$19,632.88

Combined revenue of the top 5 items — out of 32 total menu items

FINDINGS

Order patterns by shift and day type

2.25

Average items per order

Afternoon

Highest order volume of the four time-of-day shifts (47% of orders)

Daily order volume remained relatively stable across the period, with normal day-to-day variation.

What the data shows

- 1 Burger generated the highest revenue among all categories.
- 2 Big Mac was the most frequently ordered item, with 622 orders.
- 3 Meatball Marinara led individual item revenue at \$4,225.30.
- 4 Weekday revenue (\$44,029.38) outpaced weekend revenue (\$16,974.40).
- 5 Afternoon accounted for the highest share of order volume.

EXECUTIVE SUMMARY

The analysis provides a consolidated view of revenue, order volume, menu-item performance, category trends, and ordering patterns. The interactive Excel dashboard lets users explore these metrics by date, month, category, and time of day — turning a static transaction log into a tool for ongoing exploration.

Scope note: findings describe patterns in this transaction dataset and are not official McDonald's business results.
